

OBJECTIVE TYPE QUESTIONS

1. Can context-sensitive grammar be used for representing the programming language?
 (a) Yes (b) No
2. The output of the parser is
 (a) Tokens (c) Syntax tree
 (b) Parse tree (d) Non-terminals
3. Production rules can be written
 (a) Only in recursive manner
 (b) Only in non-recursive manner
 (c) Both in recursive and non-recursive manners
 (d) None of these
4. In the production rule $A \rightarrow \alpha$, the head and definition of the rule are
 (a) Terminal, non-terminal
 (b) Non-terminal, terminal
 (c) Non-terminal, grammar symbol
 (d) Non-terminal, string of grammar symbols
5. Consider the following grammar:
 $S \rightarrow aAbS$ $A \rightarrow bSaA$
 $S \rightarrow e$ $A \rightarrow c \mid d$
 The language produced by the grammar is
 (a) *abecbe* (c) *abebdbbe*
 (b) *abebecebe* (d) None of these
6. Which one of the following grammar is more powerful?
 (a) Regular grammar
- (b) Context-sensitive grammar
 (c) Context-free grammar
 (d) Unrestricted grammar
7. Parsing is done using derivations in
 (a) top-down parser (c) All of these
 (b) bottom-up parser (d) None of these
8. Ambiguities in the grammar yields
 (a) more than two parse trees
 (b) more than one parse tree
 (c) only one parse tree
 (d) no parse tree
9. Handle is
 (a) head of the grammar rule
 (b) definition of the grammar rule
 (c) set of non-terminals
 (d) set of terminals
10. Recursive descent parser is
 (a) bottom-up parser (c) All of these
 (b) top-down parser (d) None of these
11. Predictive parser is
 (a) LL(1) parser (c) LR(1) parser
 (b) LR(0) parser (d) LL(0) parser
12. Backtracking in the top-down parser
 (a) goes to the previous expansion of rule
 (b) goes to the start symbol of the grammar where there are alternative definitions

- (c) goes to the scanner and tries with other grammar
- (d) goes to the previous expansion of rule where there are alternative definitions
- Ⓐ13. After elimination of the left recursion from the grammar $A \rightarrow Ab \mid c$, it gives
- (a) $A \rightarrow cA^1, A^1 \rightarrow bA^1 \mid \epsilon$
- (b) $A \rightarrow bA^1, A^1 \rightarrow cA^1 \mid \epsilon$
- (c) $A \rightarrow cA^1, A^1 \rightarrow cA^1 \mid \epsilon$
- (d) $A \rightarrow bA^1, A^1 \rightarrow bA^1 \mid \epsilon$
- Ⓐ14. The grammar $exp \rightarrow exp-exp \mid exp/exp \mid id$ can be rewritten as
- (a) $exp \rightarrow exp A \mid id, A \rightarrow -exp \mid /exp$
- (b) $exp \rightarrow exp B \mid id, B \rightarrow -exp \mid /exp$
- (c) All of these
- (d) None of these
- Ⓐ15. Consider a grammar $A \rightarrow X_1X_2X_3X_4$. If, X_1 is a non-terminal and X_2 produces ϵ , then follow of X_1 is
- (a) $first(X_1)$ (c) $first(X_3)$
- (b) $first(X_2)$ (d) $first(X_4)$
- Ⓐ16. Is the grammar $A \rightarrow X_1X_2X_3X_4$ an operator grammar when X_1 through X_4 are non-terminals?
- (a) Yes (b) No
- Ⓐ17. The basic actions in the parsing process of any bottom-up parser are
- (a) shift, produce, accept, reject
- (b) shift, produce, accept, reject
- (c) rotate, produce, accept, reject
- (d) shift, reduce, accept, reject
- Ⓐ18. LR stands for
- (a) left to right
- (b) left to right, rightmost derivation in reverse
- (c) left to right, rightmost derivation
- (d) left to tight, right to left
- Ⓐ19. The LR(0) item $B \rightarrow a.\gamma$ refers to
- (a) the parser has completed the parsing
- (b) the parser is about to start parsing the derivatives of γ
- (c) the parser has parsed a and is about to start parsing the derivatives of γ
- (d) the parser is about to start parsing the derivatives of γ
- Ⓐ20. The LR item $\{B \rightarrow a.\gamma, b\}$ is
- (a) LR(0) item (c) LR(2) item
- (b) LR(1) item (d) None of these
- Ⓐ21. The grammar $S \rightarrow L = R$ leads to the presentation of
- (a) arithmetic expression
- (b) left to right expression
- (c) shift from left to right expression
- (d) an assignment statement
- Ⓐ22. In the LR(1) item $[A \rightarrow \alpha.\beta, b]$, which one of the following is the core item?
- (a) $A \rightarrow \alpha.$ (c) $A \rightarrow \alpha.\beta, b$
- (b) $A \rightarrow \alpha.\beta$ (d) $A \rightarrow .\beta$
- Ⓐ23. Relatively, the number of states is high in
- (a) SLR parser (c) LALR parser
- (b) CLR parser
- Ⓐ24. Yacc is
- (a) yet another compiler-computer
- (b) yet another computer-compiler
- (c) yet another computer-computer
- (d) yet another compiler-compiler
- Ⓐ25. In using Yacc tool, which one of the following sections is mandatory?
- (a) Definition section
- (b) User subroutine section
- (c) Rules section
- (d) None of these

OBJECTIVE TYPE QUESTIONS

- ① 1. A Pascal language identifier could be well represented by a
(a) regular expression (b) regular grammar
(c) regular expression and regular grammar
(d) context-free grammar
- ① 2. When any grammar symbol is concatenated with ε , it gives ε by itself.
(a) Yes (b) No
- ① 3. For the given string GOODNESS, choose the suffix of the string:
(a) GOOD (c) GOODNESS
(b) GOO (d) NESS
- ① 4. Kleene closure
(a) cleanly closes the token
(b) is one or more occurrences of the symbol
(c) is zero or more occurrences of the symbol
(d) None of these
- ① 5. If L_1 is represented by $(a \mid b \mid c)^*de$ and L_2 is represented by $(0 \mid 1 \mid 2)^*34$, then choose the right string that is generated by L_1L_2 :
(a) $ae234$ (c) $abcccd0011234$
(b) $abcccd1232$ (d) $de223$
- ① 6. Let $D \rightarrow (0 \mid 1 \mid 2 \mid 3 \mid 4 \mid 5 \mid 6 \mid 7 \mid 8 \mid 9)$ and $L \rightarrow (a \mid b \mid c \mid \dots z)$. Choose the answer with

reference to the specification of the identifier in a programming language from the following:

- (a) DL^* (c) $D(L \mid D)^*$
 (b) $L(L \mid D)^*$ (d) LD^*

- U 7. Consider Fig. 3.39: (e: event, a: action) and choose the correct answer.

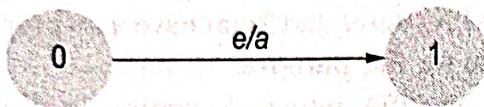

Fig. 3.39

- (a) $\text{goto}(0, e) = 1$ (c) $\text{goto}(1, a) = 0$
 (b) $\text{goto}(0, a) = 1$ (d) $\text{goto}(1, e) = 0$
- U 8. An automaton is a/an
 (a) automatic machine (c) regular machine
 (b) finite state machine (d) None of these
- U 9. NFA may have ϵ -transitions.
 (a) True (b) False
- U 10. If the regular expression is $(a \mid b).d^*$, then which of the following is valid?
 (a) dd (b) abd (c) adb (d) $bdddd$
- U 11. The function ϵ -closure(S)
 (a) finds the set of all states reachable from S on an input symbol
 (b) finds the next state reachable from the state S on an input symbol
 (c) finds the set of all states reachable from S on ϵ input
 (d) finds the next state reachable from the state S on ϵ input
- U 12. Minimizing the number of states in DFA
 (a) minimizes the scanning time
 (b) minimizes the memory requirements
 (c) All of these
 (d) None of these
- U 13. Lex is a tool for
 (a) separating the tokens in a language
 (b) generating scanner program
 (c) All of these
 (d) None of these
- U 14. The outcome of the lex utility is
 (a) *lexer* (c) *lex.yy.c*
 (b) *lex.ll.c* (d) *lex.yy.cc*
- U 15. `yywrap()` is called
 (a) at the end of the input file when using lex tool
 (b) by yacc program
 (c) to show the error message
 (d) None of these
- U 16. Can we allow the lexical error handler to correct all kinds of mistakes in the token specifications?
 (a) Yes (b) No
- U 17. Which of the following tasks are not performed by a lexical analyser?
 (a) Separating tokens
 (b) Grouping tokens into a hierarchical structure
 (c) Line counting
 (d) White space removal
- U 18. Which type of grammar is used in the lexical analysis phase?
 (a) Regular grammar
 (b) Context-free grammar
 (c) Context-sensitive grammar
 (d) Unrestricted grammar
- U 19. Which algorithm is used for minimizing a DFA?
 (a) Thompson's algorithm
 (b) Berry Sethi's algorithm
 (c) Hopcroft's algorithm
 (d) Aho Ullman's algorithm
- U 20. Which representation of an automaton is more efficient for achieving reduced access time?
 (a) Transition diagram (c) Five-tuple notation
 (b) Transition table (d) All of these
- U 21. Which of the following regular expression operators has the least precedence?
 (a) Concatenation (c) Alternation
 (b) Kleene closure (d) Positive closure
